

TX Active Photocatalytic Cement

Greenbuild 2010 Legacy Home North Suburban Chicago, Ill.

The self-cleaning, pollution-reducing properties of TX Active photocatalytic cement literally helped “pave the way” for the Greenbuild 2010 Legacy Home.

“ Built as a joint effort with the U.S. Green Building Council (USGBC), the Portland Cement Association (PCA) and Habitat for Humanity, the concrete-designed residence earned a LEED for Home Platinum rating for its use of recycled content materials, storm water management and optimized energy performance. ”

A showcase environmental feature of the suburban Chicago project were the front walk and driveway made with concrete pavers formulated with TX Active photocatalytic cement. Manufactured by Unilock, the permeable pavers empower the home with improved storm water management, pollution control and pavement reflectance.
